

Appendix D – Release Notes

Release 2.2

New field "accepting party" in the message RECADV

A new field „accepting party“ has been added to the involved partners in the header of the RECADV. The field is optional for the moment. After a transitional phase it will become mandatory.

Background : With cross docking logistics this enables to distinguish between goods receipt in a warehouse and the final arrival on the sales area.

New appendix E – IFB fields

To relate the organizational notions to the field names of the InterfaceBuilder, a new appendix E „IFB fields“ has been added.

Definition “delivery based” in the messages DESADV and RECADV

In variation 2 the notion "shipment based" has been changed to "delivery based".

Background : The logistic hierarchy distinguishes between package, delivery and shipment. Using strict terms, the messages are based on deliveries and not on shipments.

Release 2.1

New message “despatch advice for more than one order”

Although basically only one order should be contained in a despatch advice, for logistic reasons it cannot be avoided with some suppliers that mixed orders are transmitted. As with a mixture of the order-pure delivery and the delivery of more than one order, problems with the references can appear, a separate message type has been defined for this. The difference to the order-pure despatch advice consists in the fact that the order references are only permitted in the positions. Apart from that, the structure of the message is identical.

URL for picture files in the catalogue message PRICAT

To make picture files from the Internet available, it is possible to send a base URL in the header of a PRICAT which gives a complete download path concatenated with the name of the picture file.

Intrastat data in the message INVOIC

To be able to produce the intrastat report from the INVOIC directly, the weight of the position is added.

Inventory report – INVRPT

Organizational explanation to the stock date.
